

CMPE 226 Database Systems

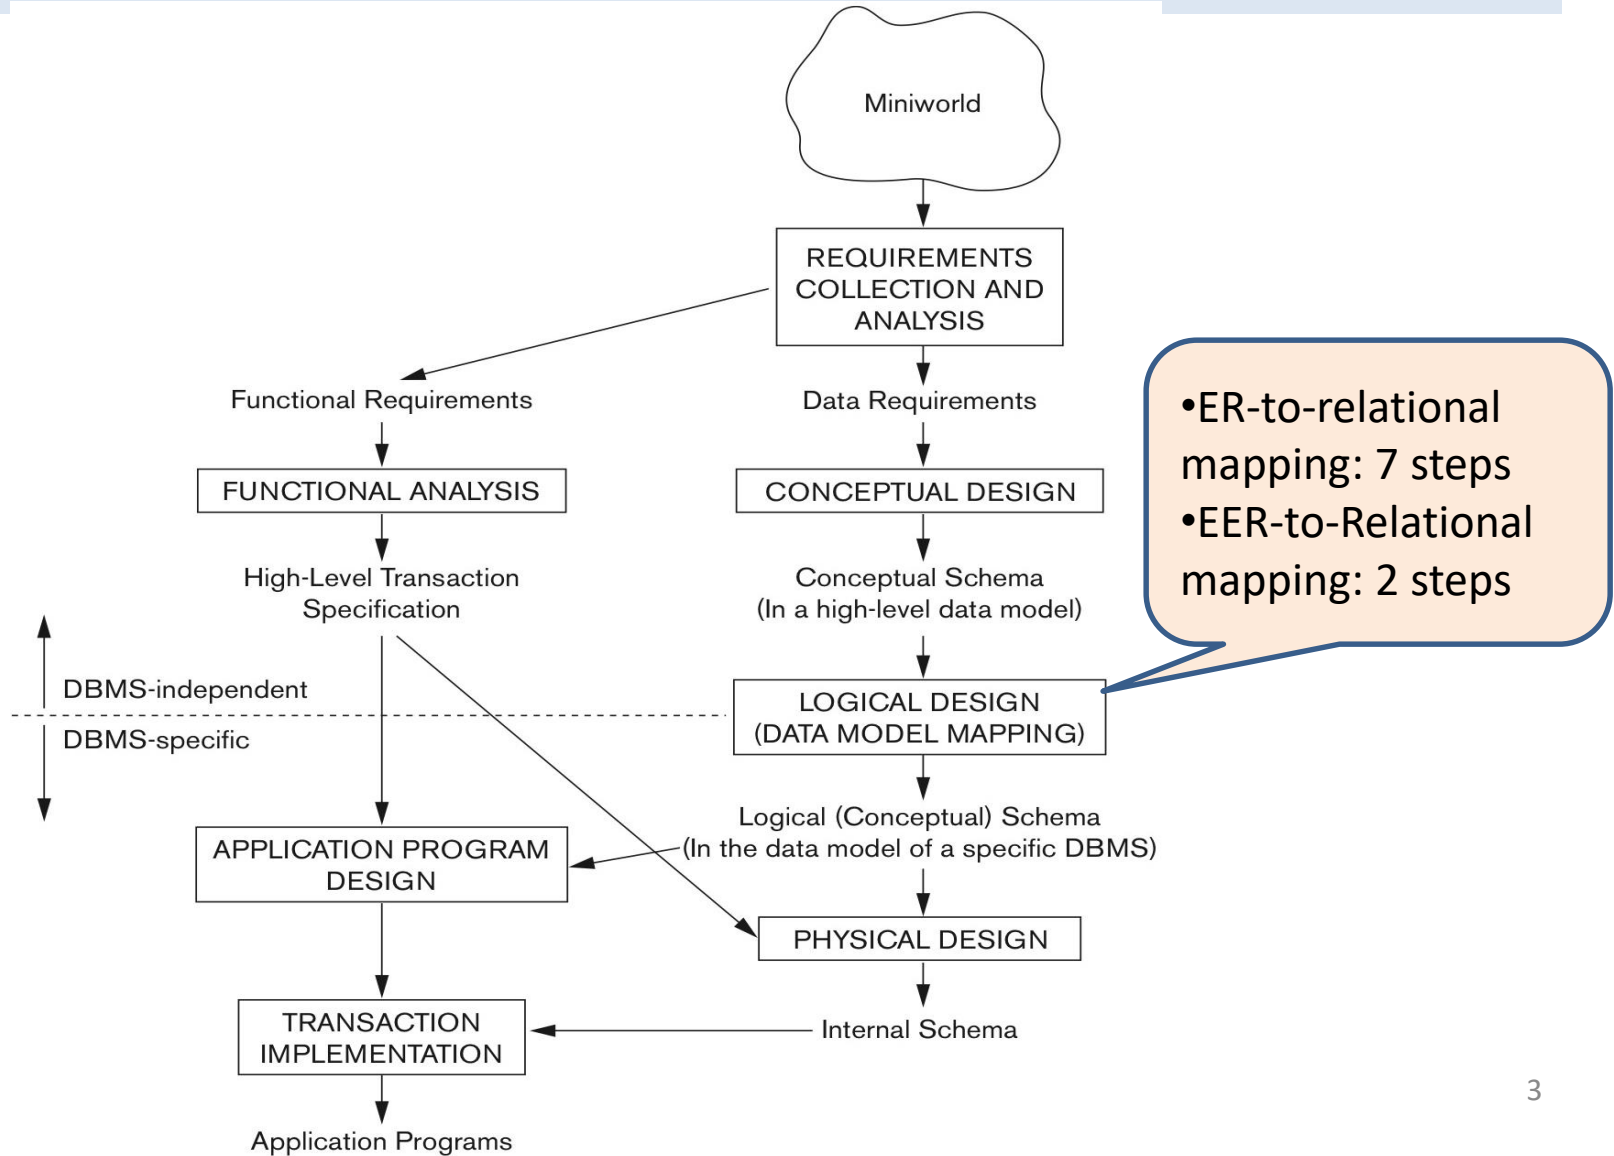

ER-to-Relational Mapping

Instructor: Kong Li

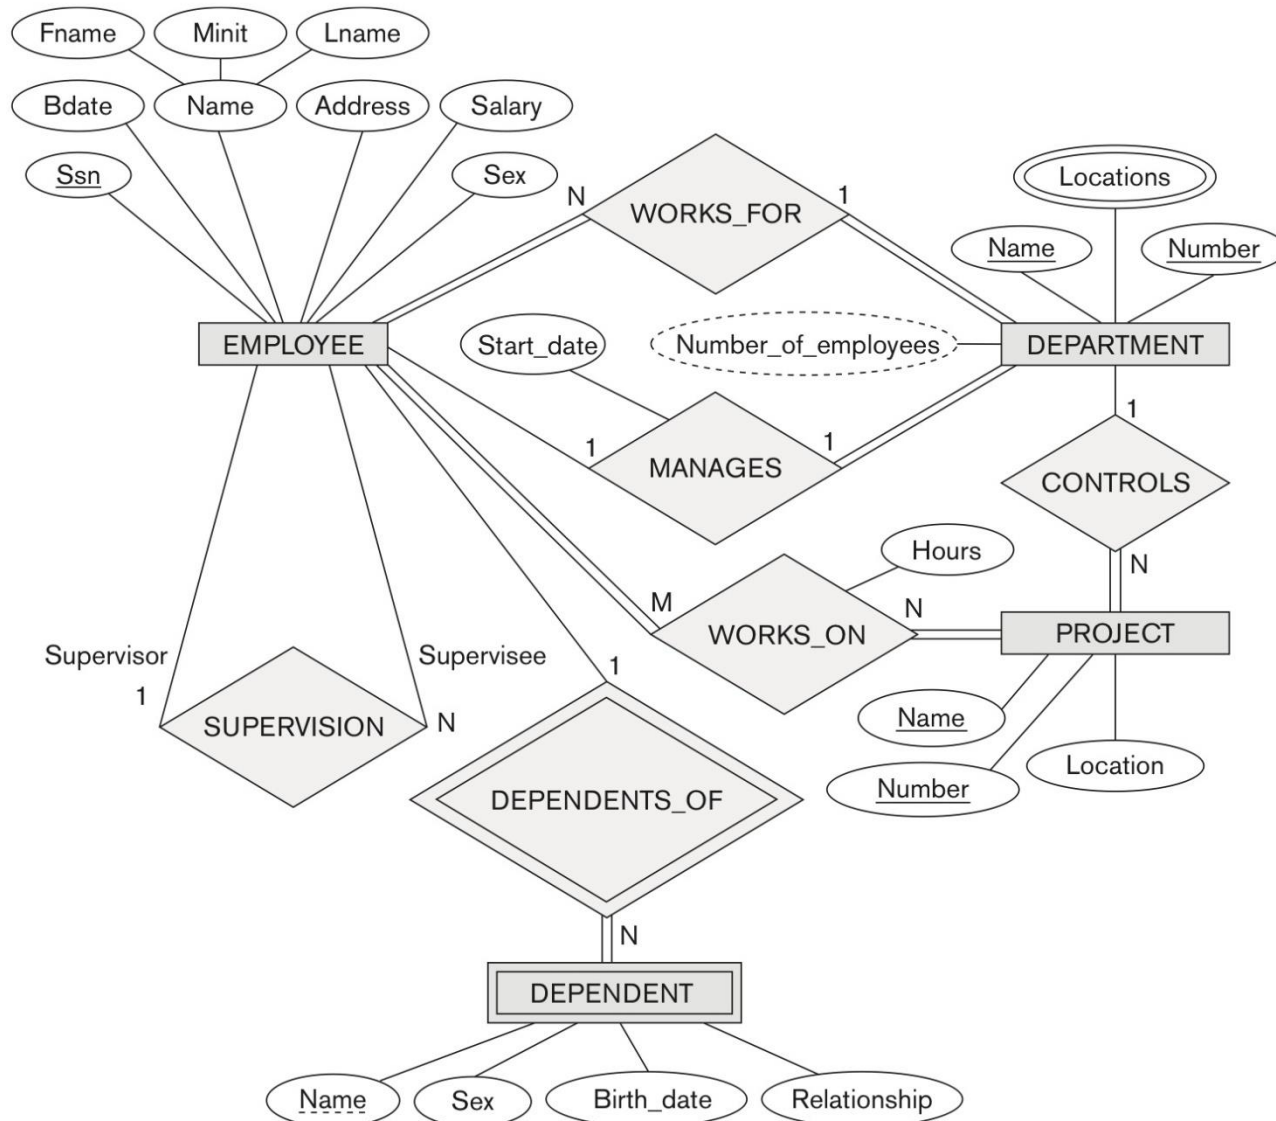

Outline

- ERD → Relational Database schema
 - Step 1 ~ 7
- EERD → Relational Database schema
 - Step 8 & 9
 - Ignore step 9

ER-to-Relational Mapping

ER Diagram: COMPANY

Result of mapping: COMPANY

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

PROJECT

Pname	<u>Pnumber</u>	Plocation	Dnum
-------	----------------	-----------	------

WORKS_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

PK: underlined

FK: points to PK

Step 1: Regular Entity

- Create a relation R that include all simple attrs
 - PK: one of key attrs
 - R is called **entity relation**
 - Each tuple represents an entity instance

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary
-------	-------	-------	------------	-------	---------	-----	--------

DEPARTMENT

Dname	<u>Dnumber</u>
-------	----------------

PROJECT

Pname	<u>Pnumber</u>	Plocation
-------	----------------	-----------

Step 2: Weak Entity

- Create a relation R that includes all simple attrs
 - PK: {PK of owner entity, partial key of weak entity}
 - PK of owner as FK attr of R
 - If weak entity type E_2 's owner is also weak entity type E_1 , E_1 should be mapped before E_2

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

- FK: CASCADE option for ON DELETE or ON UPDATE
- **No** need to map any identifying relationship

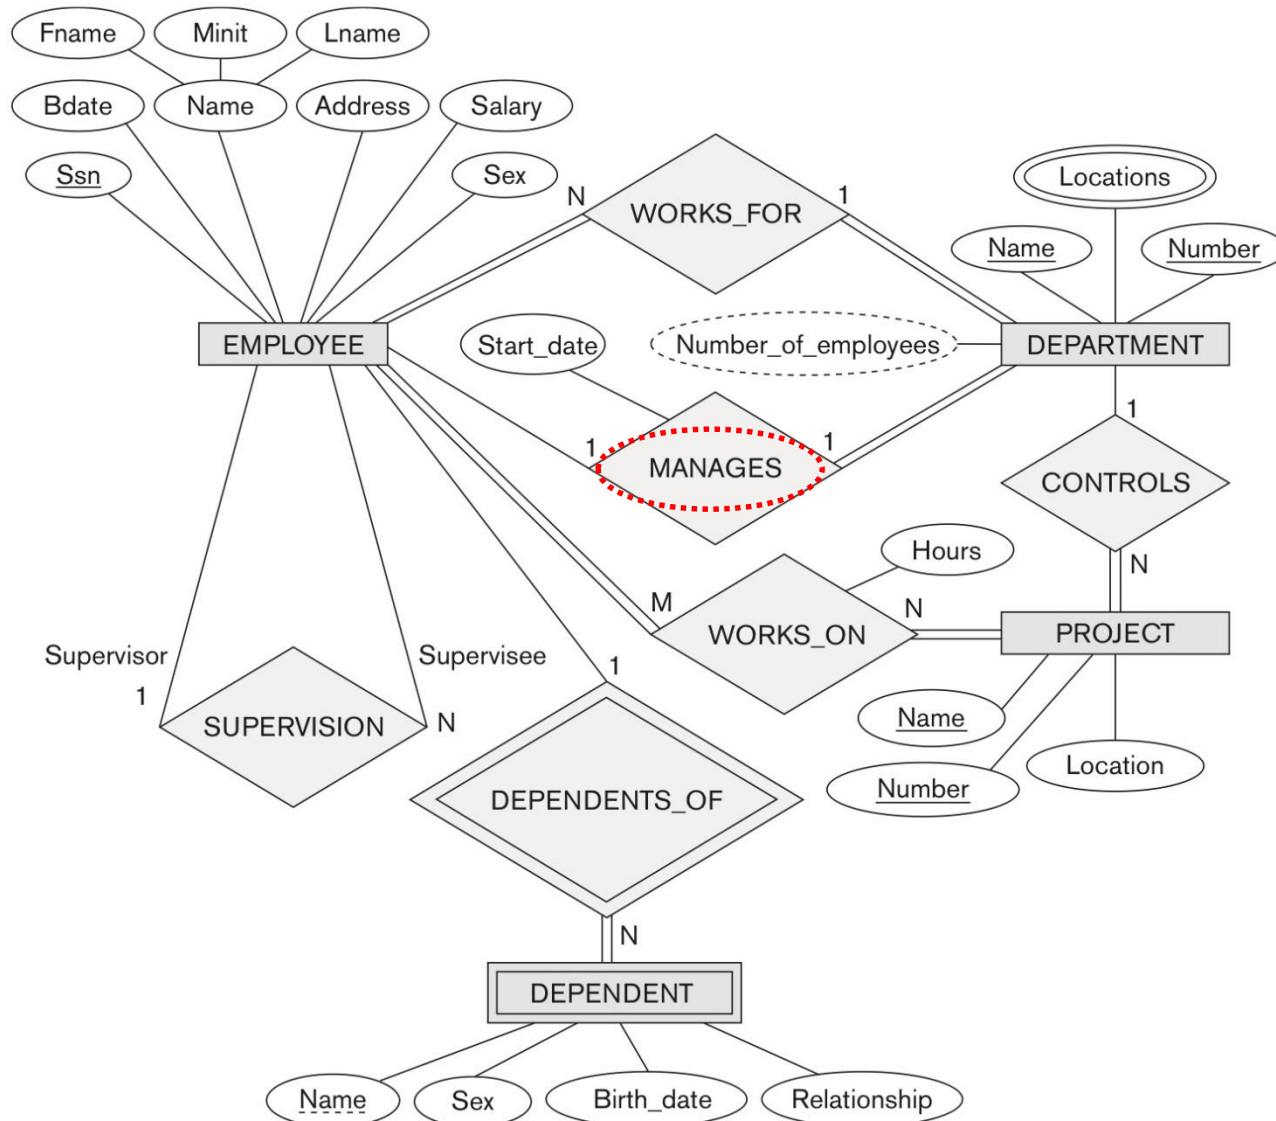

If PK of T is (a,b),
then FK: S.(a,b) to T.(a,b);
separate FKs are **not** correct

Step 3: Binary 1:1 Relationship

- **$S - R - T$**
 - R : binary 1:1 relationship type
 - S and T : entity types participating in R
- Approach #1: FK approach - recommended
 - Modify the relation S that is total participation in R
 - Include PK of T as FK in S
 - Include simple attrs of R in S
 - Ex: EMPLOYEE – manage - DEPARTMENT
 - DEPARTMENT.Mgr_ssn: FK to EMPLOYEE.Ssn
 - Start_date of relationship: DEPARTMENT.Mgr_start_date
 - Q: what if we choose T , not total participation?

ER Diagram: COMPANY

Result of mapping: COMPANY

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

PROJECT

Pname	<u>Pnumber</u>	Plocation	Dnum
-------	----------------	-----------	------

WORKS_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

PK: underlined

FK: points to PK

Step 3: Binary 1:1 Relationship (cont'd)

- Approach #2: merged relation
 - If **both** S and T are total participation, merge S , T , R to one relation
 - Not recommended due to DB normalization (later)
- Approach #3: cross-reference or relationship relation
 - Create a **relationship relation** R (or lookup table)
 - Include PKs of S and T , as FKs in R
 - PK of R : one of the two FKs, and the other is unique
 - Cons: extra relation, and JOIN is needed for retrieval
 - Required for binary M:N relationships (later)

Step 4: Binary 1:N Relationship

- $S - R - T$
 - R : binary 1:N relationship type
 - S : entity type on N-side of R , T : entity types on 1-side of R
- Approach #1: modify the relation S (N-side of R)
 - Include PK of T as FK in S
 - Include simple attrs of R as attrs of S
 - Ex
 - WORKS_FOR: EMPLOYEE.Dno as FK to DEPARTMENT.Dnumber
 - CONTROLS: PROJECT.Dnum as FK to DEPARTMENT.Dnumber
 - SUPERVISION: EMPLOYEE.Super_ssn as FK to EMPLOYEE.Essn
- Approach #2: create **relationship relation** R
 - Include PKs of S and T , as FKs in R
 - PK of R : PK of S (N side)

If PK of T is (a,b) ,
then FK: $S.(a,b)$ to $T.(a,b)$;
separate FKs are **not** correct

Result of mapping: COMPANY

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

PROJECT

Pname	<u>Pnumber</u>	Plocation	Dnum
-------	----------------	-----------	------

WORKS_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

DEPENDENT

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

PK: underlined

FK: points to PK

Step 5: Binary $M:N$ Relationship

- $S - R - T$
- Create a new **relationship relation** R
 - Include PKs of S and T as FKs in R
 - FK propagate (CASCADE) option for ON UPDATE, ON DELETE
 - PK of R (composite PK): PK of S , PK of T
 - Include any simple attrs of $M:N$ relationship type

WORKS_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

If PK of T is (a,b) ,
then FK: $S.(a,b)$ to $T.(a,b)$;
separate FKs are **not** correct

- 1:1 and 1:N relationships can be mapped to this

Step 6: Multivalued Attributes

- Create a new relation R for multivalued attr $S.A$
 - Include attr of A , and PK of S
 - PK of S as FK in R
 - FK propagate (CASCADE) option for ON UPDATE, ON DELETE
 - PK of R : $\{A, \text{PK of } S\}$
 - If the multivalued attr is composite, include its simple components

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

Q: what about a weak entity's multivalued attr?
What is the proper FKs?

Result of mapping: COMPANY

EMPLOYEE

Fname	Minit	Lname	<u>Ssn</u>	Bdate	Address	Sex	Salary	Super_ssn	Dno
-------	-------	-------	------------	-------	---------	-----	--------	-----------	-----

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
-------	----------------	---------	----------------

DEPT_LOCATIONS

<u>Dnumber</u>	<u>Dlocation</u>
----------------	------------------

PROJECT

Pname	<u>Pnumber</u>	Plocation	Dnum
-------	----------------	-----------	------

WORKS_ON

<u>Essn</u>	<u>Pno</u>	Hours
-------------	------------	-------

DEPENDENT

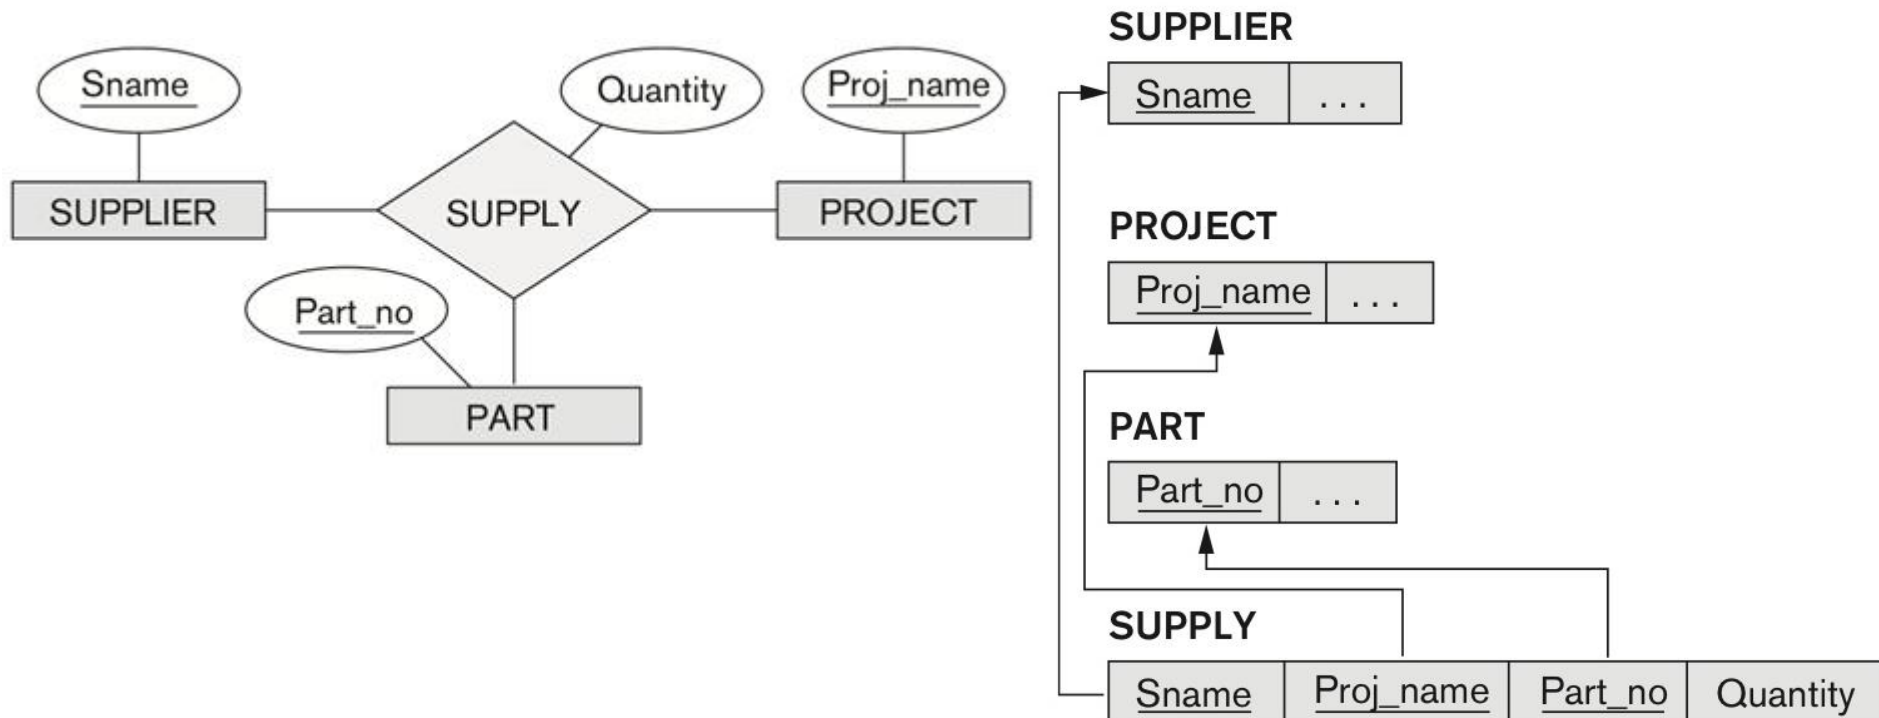

<u>Essn</u>	<u>Dependent_name</u>	Sex	Bdate	Relationship
-------------	-----------------------	-----	-------	--------------

PK: underlined

FK: points to PK

Step 7: *N*-ary Relationship Types

- Create a new relation *S* for each *n*-ary relationship *R*
 - Include PKs of participating entity types as FKs in *S*
 - PK of *S*: {PKs of participating entity types}
 - Include any simple attrs as attrs

Summary of Mapping

Table 9.1 Correspondence between ER and Relational Models

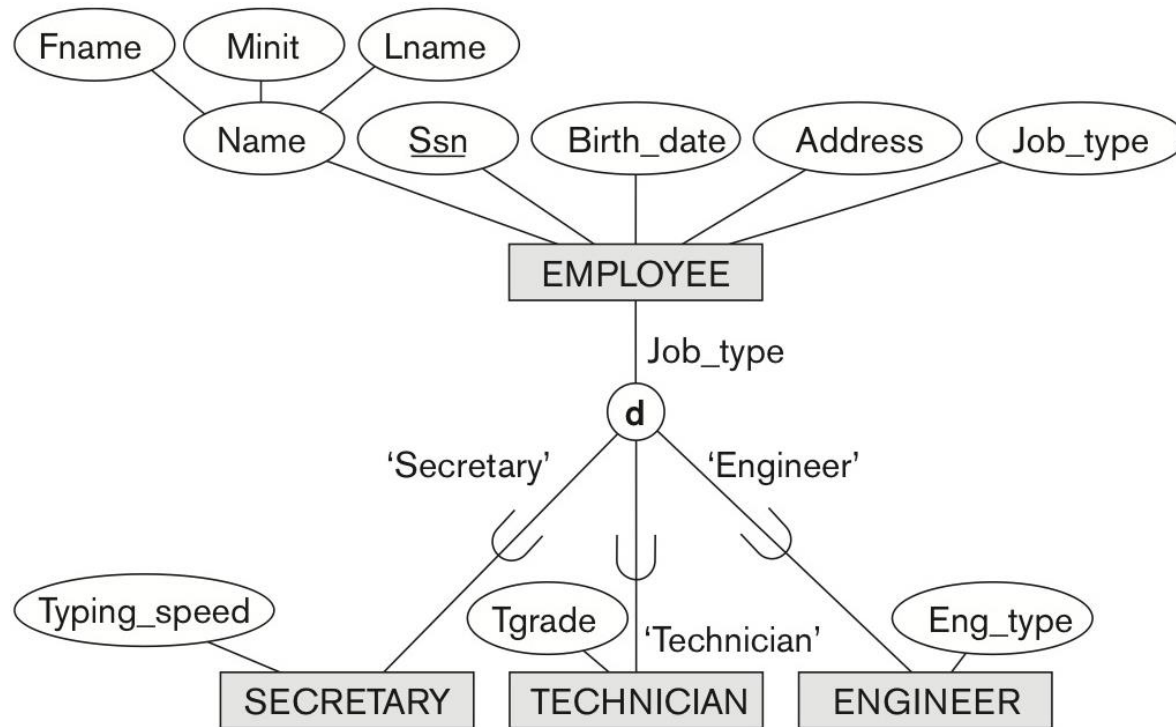

ER MODEL	RELATIONAL MODEL
Entity type	<i>Entity</i> relation
1:1 or 1:N relationship type	Foreign key (or <i>relationship</i> relation)
M:N relationship type	<i>Relationship</i> relation and <i>two</i> foreign keys
<i>n</i> -ary relationship type	<i>Relationship</i> relation and <i>n</i> foreign keys
Simple attribute	Attribute
Composite attribute	Set of simple component attributes
Multivalued attribute	Relation and foreign key
Value set	Domain
Key attribute	Primary (or secondary) key

- Relationship types in relational schema
 - Relationship types may *not* be represented explicitly
 - Represented by (1) new attr, or (2) new relation
 - Data retrieval: EQUIJOIN or natural join

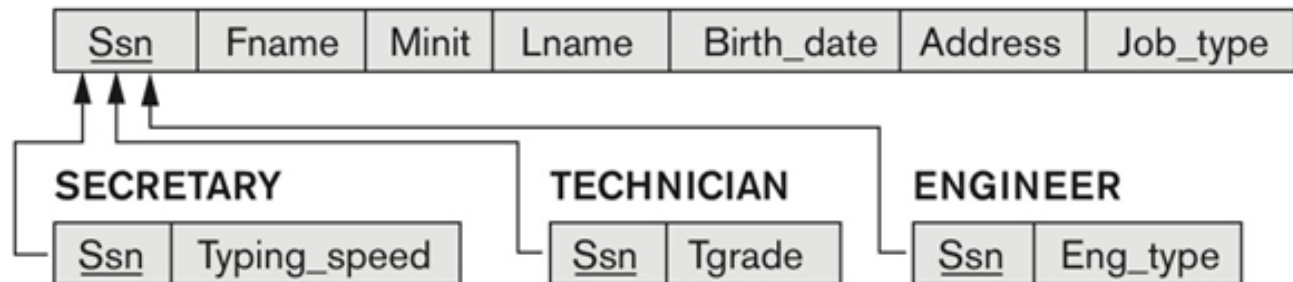

Step 8: Specialization / Generalization

- Superclass $C(\underline{k}, a_1, \dots, a_n)$, and m subclasses $\{S_1, \dots, S_m\}$
- Option 8A: Multiple relations — superclass and subclasses
 - Create a new relation L for C
 - $\text{Attrs}(L) = \{\underline{k}, a_1, \dots, a_n\}$
 - $\text{PK}(L) = k$
 - Create a new relation L_i for each S_i
 - $\text{Attrs}(L_i) = \{k\} \cup \text{Attrs}(S_i)$
 - $\text{PK}(L_i) = k$
 - Good for any specialization (total or partial, disjoint or overlapping)

Option 8A

(a) **EMPLOYEE**

Step 8: Specialization / Generalization (cont'd)

- Superclass $C(\underline{k}, a_1, \dots, a_n)$, and m subclasses $\{S_1, \dots, S_m\}$
- Option 8B: Multiple relations—subclass relations only
 - Create a new relation L_i for each S_i
 - $\text{Attrs}(L_i) = \text{Attrs}(S_i) \cup \{k, a_1, \dots, a_n\}$
 - $\text{PK}(L_i) = k$
 - Good for
 - Subclasses are total (each entity in superclass must belong to at least one of the subclasses), **AND**
 - Specialization is disjoint
 - If overlapping, the same entity may be duplicated in several relations

Option 8B

(b)

(b) CAR

<u>Vehicle_id</u>	License_plate_no	Price	Max_speed	No_of_passengers
-------------------	------------------	-------	-----------	------------------

TRUCK

<u>Vehicle_id</u>	License_plate_no	Price	No_of_axles	Tonnage
-------------------	------------------	-------	-------------	---------

Step 8: Specialization / Generalization (cont'd)

- Superclass $C(\underline{k}, a_1, \dots, a_n)$, and m subclasses $\{S_1, \dots, S_m\}$
- Option 8C: Single relation with one type attr
 - Create a single relation L
 - $\text{Attrs}(L) = \{k, a_1, \dots, a_n\} \cup \text{Attrs}(S_1) \cup \dots \cup \text{Attrs}(S_m) \cup \{t\}$
 - T : type attr, indicating the subclass to which the tuple belong
 - Good for disjoint subclasses
 - Potential for generating many NULL values if many specific attrs exist in the subclasses

Option 8C

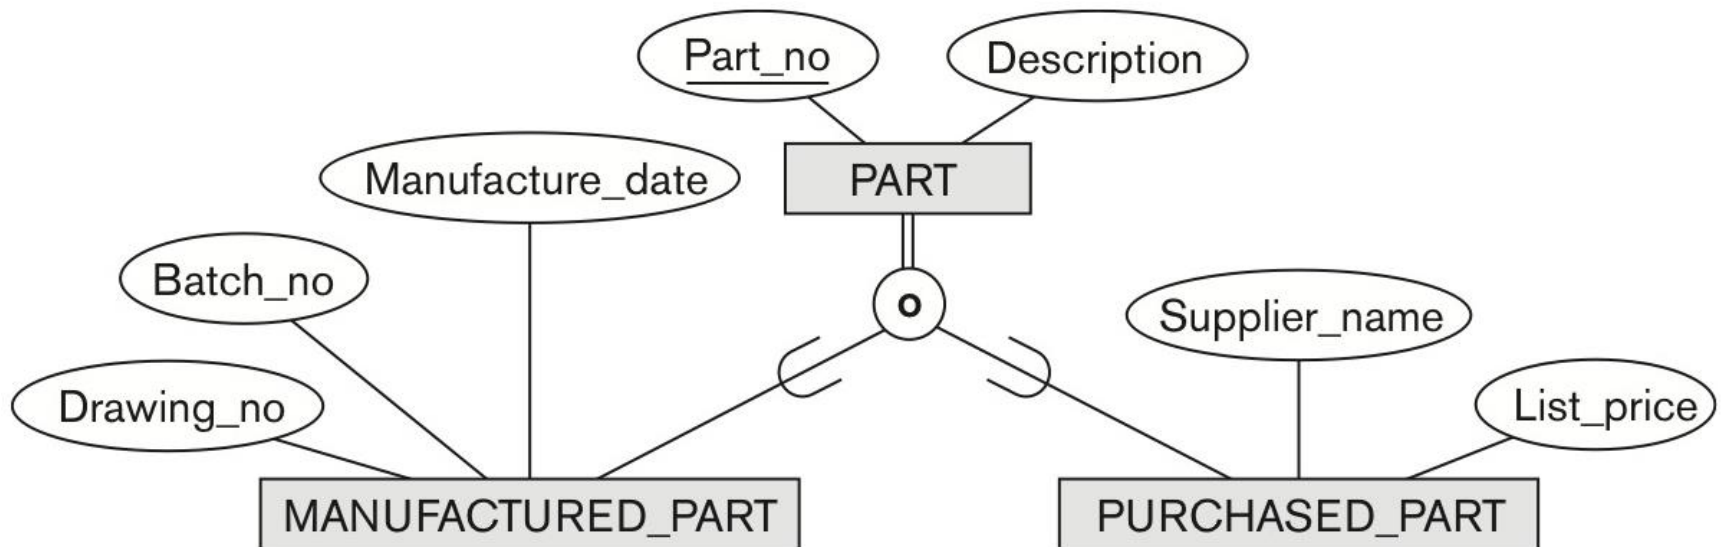

(c) EMPLOYEE

<u>Ssn</u>	Fname	Minit	Lname	Birth_date	Address	Job_type	Typing_speed	Tgrade	Eng_type
------------	-------	-------	-------	------------	---------	----------	--------------	--------	----------

Step 8: Mapping Specialization or Generalization (cont'd)

- Superclass $C(\underline{k}, a_1, \dots, a_n)$, and m subclasses $\{S_1, \dots, S_m\}$
- Option 8D: Single relation with multiple type attrs
 - Create a single relation L
 - $\text{Attrs}(L) = \{k, a_1, \dots, a_n\} \cup \text{Attrs}(S_1) \cup \dots \cup \text{Attrs}(S_m) \cup \{t_1, \dots, t_m\}$
 - $\text{PK}(L) = k$
 - t_i : boolean type attr, true if a tuple belong to subclass S_i
 - Good for
 - subclasses are overlapping or disjoint

Option 8D

(d) PART

<u>Part_no</u>	Description	Mflag	Drawing_no	Manufacture_date	Batch_no	Pflag	Supplier_name	List_price
----------------	-------------	-------	------------	------------------	----------	-------	---------------	------------

Table mapping exercises

- A partial key is a composite attr
- A multi-valued attr of a weak entity
- A multi-valued attr of a M:N relationship

If drawing is not possible (e.g., online exam)

- Employee(ssn, fname, lname, super_ssn, dno)
 - PK: ssn
 - FK: (super_ssn) -> Employee(ssn)
 - FK: (dno) -> Department(dnumber)
- Department(dnumber, dname)
 - PK: dnumber
- Dependent(essn, fname, sex)
 - PK: (essn, fname)
 - FK: (essn) -> Employee(ssn)

Summary

- Schema diagrams
- Mapping
 - Entity
 - Weak entity
 - 1:1 relationship
 - 1:N relationship
 - M:N relationship
 - Multi-value attr
 - N-ary relationship
 - Specialization, generalization

Self Exercise

- Earlier HW: ERD to table mapping
- 7/E: Exercise 9.4, 9.5, 9.6, 9.8
- 6/E: Exercise 9.4, 9.5, 9.6, 9.8
